## Version History

Version	Issue date	Notes
1.1.2	14 Jul 2010	<ul style="list-style-type: none"> <li>• First issue release.</li> <li>• Comms revision to 1.1.2</li> <li>• Added payout by denomination commands.</li> </ul>
1.1.3	27 Oct 2010	<ul style="list-style-type: none"> <li>• Added bezel mode command.</li> </ul>
1.2.0	25 May 2011	<ul style="list-style-type: none"> <li>• Added multi-currency commands.</li> <li>• Corrected fraud response format.</li> </ul>
1.2.1	23 Apr 2012	<ul style="list-style-type: none"> <li>• Added coin feeder support commands.</li> </ul>
1.2.2	12 Jul 2012	<ul style="list-style-type: none"> <li>• Added SMART Empty command and events.</li> <li>• Added coin inhibits channel commands.</li> </ul>
1.2.3	05 Oct 2012	<ul style="list-style-type: none"> <li>• First new format issue.</li> <li>• Corrected Set Inhibit Peripheral Device Value command.</li> <li>• Added Get Inhibit Peripheral Device Value command.</li> <li>• Added supported cctalk commands.</li> <li>• Added status event Peripheral device disabled.</li> <li>• Deprecation of PIN commands 219,218.</li> </ul>
1.2.4	23 Oct 2012	<ul style="list-style-type: none"> <li>• Added SMART Payout support to <a href="#">Set Payout Options</a> and <a href="#">Get Payout Options</a>.</li> <li>• New status event added in response to <a href="#">Request Status</a> and <a href="#">Request Status (with currency support)</a> - Note in Bezel Hold.</li> <li>• Modification to <a href="#">Set Bezel Mode</a> command.</li> <li>• Corrected response sizes in <a href="#">Request Status</a> command.</li> </ul>

## Introduction

The CC2 protocol provides commands to pay-out notes/coins from ITL payout devices by multiple possible methods over a cctalk packet system.

This specification documents the commands used by a device to drive SMART Hopper, SMART Payout and SMART Feeder products using ccTalk commands.

**This removes the security provided by the eSSP encryption layer and suitable physical security should be employed to protect the ccTalk bus.**

This document should be used in conjunction with the generic cctalk specification documents available for download at <http://www.cctalk.org>

## Representations

Values are represented as 32 bit unsigned integer (4 bytes) and in the lowest value of currency. For example 125.65 would be 0x00003115.

When sending or receiving a value the Least significant byte is sent first. So in this example [0x15] [0x31] [0x00] [0x00] will be sent. When using commands with multi-currency support all values will be followed by a 3 byte ASCII Currency code (e.g. 069 085 082 for EUR)

Packet examples are show unencrypted using an 8 bit checksum with host address of 1 and device address of 3.

## Pay-out Encryption

The pay-out devices support various levels of encryption. These options are configured on an individual device off-line by PC tools. Options:

- Level 0 No encryption. All packets are plain with 8-bit checksum. No payout commands are encrypted. THIS IS THE LOWEST LEVEL OF SECURITY AND THE USER WOULD NEED TO CONSIDER THE POSSIBILITY OF BUS HI-JACK FRAUDS WITH THIS OPTION.
  - Level 1 Type 1 security bytes for payout commands.
  - Level 2 Type 2 security bytes for payout commands.
  - DES Encryption for payout commands.
- Packet Encryption Options:
- BNV packet encryption.
  - All packets are encrypted using Money Controls BNV security algorithm
  - Packet checksum
  - Option of using 8bit addition or 16bit CRC checksum.

## Command Index

Simple Poll	254	Address Poll	253
Address Clash	252	Address Change	251
Address Random	250	Request Polling Priority	249
Request Manufacturer ID	246	Request Equipment Category ID	245
Request Product Code	244	Request Serial Number	242
Request Software Revision	241	Set Note Inhibit Channels	231
Request Note Channel inhibits	230	Set Master Inhibit Status	228
Get Master Inhibit Status	227	Request Data Storage Capability	216

## CC2 Command List

Complete listing of all CC2 commands

[back to index](#)

Command name	Code dec	Code hex
<b>Simple Poll</b>	<b>254</b>	<b>0xFE</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

Command to check the correct operation of communication and to confirm the presence in the bus of a device. If no reply is received to the request sent (Reception timeout in Machine), it will indicate that the device is faulty or not connected. All the cctalk peripherals must respond to a Simple Poll, regardless of the cctalk communication protocol level that has been implemented.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	254	254
-----	-----	-----	-----	-----

hex

03	00	01	FE	FE
----	----	----	----	----

### Response

Returns ACK

dec

001	000	003	000	252
-----	-----	-----	-----	-----

hex

01	00	03	00	FC
----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Address Poll</b>	<b>253</b>	<b>0xFD</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

The host sends this command as a broadcast address packet (0 destination address). The device responds with a single byte containing its address with a series of delays: Disable rx port Delay ( 4 \* addr ) ms Send [ addr ] Delay 1200 - ( 4 \* addr ) ms Enable rx port

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	253	255
-----	-----	-----	-----	-----

hex

03	00	01	FD	FF
----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Address Clash</b>	<b>252</b>	<b>0xFC</b>

Supported on devices:

SMART Payout
--------------

### Description

This command is transmitted to a specified address. It attempts to determine if one or more devices share the same address. The device returns a single byte of address data after a random delay: Slave Response  
 Algorithm  $r = \text{rand}(256)$  // random value in the range 0 to 255  
 Disable rx port  
 Delay  $(4 * r)$  ms  
 Send [ addr ]  
 Delay  $1200 - (4 * r)$  ms  
 Enable rx port

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	252	000
-----	-----	-----	-----	-----

hex

03	00	01	FC	00
----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Address Change</b>	<b>251</b>	<b>0xFB</b>

Supported on devices:

SMART Payout
--------------

### Description

This command allows the addressed device to have its address changed for subsequent commands. The host sends 1 data byte, the value of which is the new address. It is a good idea to make sure that 2 devices do not share the same address before sending this command. A full ACK message is returned. Note the ACK is sent back from the original address, not the changed address. In other words, the change to the ccTalk address field is done after the ACK is returned rather than before.

This example is a request to change address of device address to address 4.

dec

003	001	001	251	004	252
-----	-----	-----	-----	-----	-----

hex

03	01	01	FB	04	FC
----	----	----	----	----	----

### Response

The device responds with its original address.

dec

001	000	003	000	252
-----	-----	-----	-----	-----

hex

01	00	03	00	FC
----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Address Random</b>	<b>250</b>	<b>0xFA</b>

Supported on devices:

SMART Payout
--------------

### Description

This command allows the addressed device to have its address changed to a random value. This is the escape route when you find out that one or more devices share the same address. A full ACK message is returned.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	250	002
-----	-----	-----	-----	-----

hex

03	00	01	FA	02
----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Request Polling Priority</b>	<b>249</b>	<b>0xF9</b>

Supported on devices:

### Description

This is an indication by a device of the recommended polling interval for buffered credit information. Polling a device at an interval longer than this may result in lost credits. [ units ] 0 - special case, see below 1 - ms 2 - x10 ms 3 - seconds 4 - minutes 5 - hours 6 - days 7 - weeks 8 - months 9 - years

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	249	003
-----	-----	-----	-----	-----

hex

03	00	01	F9	03
----	----	----	----	----

### Response

The response is 2 bytes. See the description above for explanation. In this example, the device has a polling priority of 200ms.

dec

001	002	003	000	002	020	228
-----	-----	-----	-----	-----	-----	-----

hex

01	02	03	00	02	14	E4
----	----	----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Request Manufacturer ID</b>	<b>246</b>	<b>0xF6</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

### Description

This command returns the ASCII code for the manufacturer of the device. In this case ITL

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	246	006
-----	-----	-----	-----	-----

hex

03	00	01	F6	06
----	----	----	----	----

### Response

Example response showing ITL code

dec

001	003	003	000	073	084	076	016
-----	-----	-----	-----	-----	-----	-----	-----

hex

01	03	03	00	49	54	4C	10
----	----	----	----	----	----	----	----

ascii

.	.	.	.	I	T	L	.
---	---	---	---	---	---	---	---

[back to index](#)

Command name	Code dec	Code hex
<b>Request Equipment Category ID</b>	<b>245</b>	<b>0xF5</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

Returns the type of connected device as ascii array.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	245	007
-----	-----	-----	-----	-----

hex

03	00	01	F5	07
----	----	----	----	----

### Response

example showing data response for SMART\_HOPPER.

dec

001	012	003	000	083	077	065	082	084	095	072	079	080	080	069	082	060
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

01	0C	03	00	53	4D	41	52	54	5F	48	4F	50	50	45	52	3C
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

ascii

.	.	.	.	S	M	A	R	T	_	H	O	P	P	E	R	
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--

[back to index](#)

Command name	Code dec	Code hex
<b>Request Product Code</b>	<b>244</b>	<b>0xF4</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

### Description

This command returns the device product code. The complete identification of the product can be determined by the use of the [Request product code] command followed by the [Request build code] command.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	244	008
-----	-----	-----	-----	-----

hex

03	00	01	F4	08
----	----	----	----	----

### Response

Example response showing SMART Hopper code SH3.

dec

001	003	003	000	083	072	051	043
-----	-----	-----	-----	-----	-----	-----	-----

hex

01	03	03	00	53	48	33	2B
----	----	----	----	----	----	----	----

ascii

.	.	.	.	S	H	3	.
---	---	---	---	---	---	---	---

[back to index](#)

Command name	Code dec	Code hex
<b>Request Serial Number</b>	<b>242</b>	<b>0xF2</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

In reply to this command, the Device sends the serial number of the device in a 3-byte code.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	242	010
-----	-----	-----	-----	-----

hex

03	00	01	F2	0A
----	----	----	----	----

### Response

Example showing serial number return from a device with code 4321432

dec

001	003	003	000	152	240	065	048
-----	-----	-----	-----	-----	-----	-----	-----

hex

01	03	03	00	98	F0	41	30
----	----	----	----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Request Software Revision</b>	<b>241</b>	<b>0xF1</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command will return the full software revision of the device as an ASCII string.

Parameters

This command has no parameters

Command packet example:

dec

003	000	001	241	011
-----	-----	-----	-----	-----

hex

03	00	01	F1	0B
----	----	----	----	----

Response

Example showing software revision of NV00093333453000

dec

001	016	003	000	078	086	048	048	048	057	051	051	051	051	052	053	051	048	048	048	135

Command name	Code dec	Code hex
<b>Set Note Inhibit Channels</b>	<b>231</b>	<b>0xE7</b>

Supported on devices:

SMART Payout
--------------

Description

This command sets the inhibit status of each of the 16 available channels on a bill acceptor device.

Command has two byte bit field. Each bit represents a bill channel. bit 0 = channel1 to bit 15 = channel 16. Set to 0 to inhibit channel, 1 to enable channel. This example shows a command set to enable channels 1,2 and 3 only.

Command name	Code dec	Code hex
<b>Request Note Channel inhibits</b>	<b>230</b>	<b>0xE6</b>

Supported on devices:

SMART Payout
--------------

### Description

This command returns the status of the two byte inhibit register for the bill channels of a note accepting device.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	230	022
-----	-----	-----	-----	-----

hex

03	00	01	E6	16
----	----	----	----	----

### Response

Response returns the two byte inhibit register. bit 0 = channel 1 to bit 15 = channel 16. This example shows a register setup of channel 2,3 and 4 enabled and all others inhibited.

dec

001	002	003	000	014	000	236
-----	-----	-----	-----	-----	-----	-----

hex

Command name	Code dec	Code hex
<b>Set Master Inhibit Status</b>	<b>228</b>	<b>0xE4</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

A command to globally enable or disable the payout device or bill validator for payout/paying in operations. This value is stored in volatile ram and will be set to disabled state after a reset.

Command has 1 data byte which is a bit field. Bit 0 controls the Master inhibit state (0 = disable, 1 = enable) Bits 1-7 are not used. The example shows a command to set the master inhibit state to enable.

dec

003	001	001	228	001	022
-----	-----	-----	-----	-----	-----

hex

03	01	01	E4	01	16
----	----	----	----	----	----

### Response

ACK response.

dec

Command name	Code dec	Code hex
<b>Get Master Inhibit Status</b>	<b>227</b>	<b>0xE3</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command returns the current status of the Master inhibit value from the device.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	227	025
-----	-----	-----	-----	-----

hex

03	00	01	E3	19
----	----	----	----	----

### Response

Response contains the master inhibit status register byte. Bit 0 gives the status: 0 is disabled, 1 is enabled. Bits 1 to 7 are not used. This response shows the master inhibit set disabled.

dec

001	001	003	000	000	251

[back to index](#)

Command name	Code dec	Code hex
<b>Read Buffered Bill Events</b>	<b>159</b>	<b>0x9F</b>

Supported on devices:

SMART Payout
--------------

Description

This command gives of the last 5 bill events on a bill accepting device. The return data is formatted as 11 bytes... byte 0 is an event counter. This is incremented on each event. The event codes are 5 two byte pairs, Byte A and Byte B. The codes are explained in the table below.

Parameters

This command has no parameters

Command packet example:

dec

003	000	001	159	093
-----	-----	-----	-----	-----

hex

03	00	01	9F	5D
----	----	----	----	----

Response

This example shows 2 events returned. 2,1 is a valid bill in channel 2 held in escrow, 0,3 is note rejected due to transport problem.

dec

001	011	003	000	002	000	003	002	001	000	000	000	000	000	000	233

[back to index](#)

Command name	Code dec	Code hex
<b>Request Bill id</b>	<b>157</b>	<b>0x9D</b>

Supported on devices:

SMART Payout
--------------

**Description**

This command will return the ascii bill data for a requested channel. The return data is formatted as a 7 character identification code [ C ] [ C ] [ V ] [ V ] [ V ] [ V ] [ I ] CC = Standard 2 letter country code e.g. EU for the euro. VVVV = Bill value in terms of the country scaling factor I = Issue code. Starts at A and progresses B, C, D, E

The command takes 1 byte data which represents the bill channel of the ID required. In this example we require the id data of channel 2.

dec

003	001	001	157	001	093
-----	-----	-----	-----	-----	-----

hex

03	01	01	9D	01	5D
----	----	----	----	----	----

**Response**

7 ascii bytes are returned, formatted as described above. In this example channel 2 contains EUR 10 bill. The ascii string returned is EU0010A

dec

001	007	003	000	069	085	048	048	049	048	065	089
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

01	07	03	00	45	55	30	30	31	30	41	59
----	----	----	----	----	----	----	----	----	----	----	----

ascii

.	.	.	.	E	U	0	0	1	0	A	Y
---	---	---	---	---	---	---	---	---	---	---	---

If the channel is not supported, all zeros are returned.

dec

001	007	003	000	048	048	048	048	048	048	048	165
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

01	07	03	00	30	30	30	30	30	30	30	A5
----	----	----	----	----	----	----	----	----	----	----	----

ascii

.	.	.	.	0	0	0	0	0	0	0	.
---	---	---	---	---	---	---	---	---	---	---	---

[back to index](#)

Command name	Code dec	Code hex
<b>Request Country Scaling Factor</b>	<b>156</b>	<b>0x9C</b>

Supported on devices:

SMART Payout
--------------

Description

A request to return the scaling factor and decimal place position for the given country code.

The command data contains two byte ascii country code. In this example EU is 085,069.

dec

003	001	001	156	085	010
-----	-----	-----	-----	-----	-----

hex

03	01	01	9C	55	0A
----	----	----	----	----	----

Response

For a supported country code then 3 value bytes are returned. bytes 0 and 1 are the value multiplier (scaling factor). Byte 2 is the number of decimal places. In this example scaling factor = 100, decimal places = 2. So a channel value of 100 would be a real value of  $100 * 100/100 = 100.00$

dec

001	003	003	000	100	000	002	147
-----	-----	-----	-----	-----	-----	-----	-----

hex

01	03	03	00	64	00	02	93
----	----	----	----	----	----	----	----

If the country code is not supported, then all zeros are returned.

dec

001	003	003	000	000	000	000	249
-----	-----	-----	-----	-----	-----	-----	-----

hex

01	03	03	00	00	00	00	F9

[back to index](#)

Command name	Code dec	Code hex
Switch Encryption Code	137	0x89

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

The host can change the current BNV encryption key to a new value using this command. The command is encrypted with the old key and the response by the device encrypted with the old key. The new key will then take effect but will only persist in memory until it is either changed again or the device is reset. Use the Store Encryption Code command to persistently store this new code.

Example to set new key to 987654. Data bytes are packed so byte 2 = 98h (84 dec), byte 1 = 76h (118 dec), byte 0 = 54h (154 dec)

dec

003	003	001	137	084	118	152	014
-----	-----	-----	-----	-----	-----	-----	-----

hex

03	03	01	89	54	76	98	0E
----	----	----	----	----	----	----	----

### Response

ACK for successful change.

dec

Command name	Code dec	Code hex
<b>Request Encryption Support</b>	<b>111</b>	<b>0x6F</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command will return data about the device encryption configuration to allow host machine installation and configuration. This command will respond even if the device has BNV encryption set and the command is sent unencrypted. The commands data bytes act as a validation signature. Response Data: [Protocol level] [Command level] [Protocol key size] [Command key size] [Command block size] [Trusted mode ] [ BNV2 | BNV1 ] [ BNV4 | BNV3 ] [ BNV6 | BNV5 ] [ DES1 ] [ DES2 ] [ DES3 ] [ DES4 ] [ DES5 ] [ DES6 ] [ DES7 ] [ DES8 ]

The validation data (0xAA 0x55 0x00 0x00 0x55 0xAA) bytes are sent to ensure that the command can not be confused if sent as an encrypted packet from another command.

Command name	Code dec	Code hex
Switch DES key	110	0x6E

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command allows the host to change the current DES key. The old key and new key are interleaved and the two blocks of 8 byte data are encrypted with the old key. The device then decrypts the data and checks that the old keys match. If so then the swap is made an ACK is sent to the host and the new key stored in persistent memory. If the keys do not match then no reply is sent. This command can also be sent for key verification. If the host sets the new and old keys to the same value then the device will reply with an ACK if the key is correct or no reply if the key sent is not correct.

### Command data format

Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8	Byte 9	Byte 10	Byte 11	Byte 12	Byte 13	Byte 14	Byte 15
old 1	new 1	old 2	new 2	old 3	new 3	old 4	new 4	old 5	new 5	old 6	new 6	old 7	new 7	old 8	new 8

### Response

ACK response for successfull change

<b>Request Encrypted Status</b>	<b>109</b>	<b>0x6D</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

To guard against ACK/NACK hijack frauds this command may be used to determine the status of the device. The command may be sent after a payout or if a NACK was received to a payout command to verify the status of the device. The host send 3 challenge bytes, which are then embedded in the reply from the device to verify correct peripheral response.

Commad data contains 3 bytes of host generated data.

<b>Get Inhibit Peripheral Device Value</b>	<b>053</b>	<b>0x35</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

Description

This command returns the current status of the Master Inhibit value from the device indicated by the peripheral code.

Command has 8 data bytes. Byte 0 = periferal code, 0 = coin mech, 1 = coin feeder. Bytes 1-4 are the coin value, bytes 5-7 are the acsii country code. This example is a command to return the state of a coin feeder coin channel value 0.20 EUR.

<b>Get Cashbox Operation Data</b>	<b>052</b>	<b>0x34</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

Description

This command allows the host to obtain individual levels of each coin denomination emptied to the cashbox after a Smart empty operation.

Parameters

This command has no parameters

Command packet example:

dec

003	000	001	052	200
-----	-----	-----	-----	-----

hex

03	00	01	34	C8
----	----	----	----	----

Response

The device responds with an ACK and an array of data: byte 0 - number of denominations, then 9 bytes for each of the denominations giving 2 bytes for the level of coins emptied, 4 bytes for the coin value and 3 bytes for the ascii country code. There the follows 4 bytes giving a count of unknown coins emptied. This example shows that a hopper with 3 denominations of EUR coins was emptied. There were 10 x 0.20 cent coins, 50 x 1.00 coins and 20 x 2.00 coins. 5 unknown coins were also emptied.

<b>Set Inhibit Peripheral Device Value</b>	<b>050</b>	<b>0x32</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

**Description**

A command to enable or disable a coin value for the attached coin paying-in mechanism or coin feeder. The peripheral device type is address by the device code byte. If the command is not successfully executed, then a NACK will be returned with one data byte giving the reason failure. This value is stored in volatile ram and will be set to disabled state after a reset.

Command has 9 data bytes: Byte 0 - Peripheral code, 0 = coin mech, 1= coin feeder. Byte 1 enable state, 1 = enable, 0 = disable. Bytes 2-5 - 4 byte coin value. Bytes 6-8 the ascii country code. This example is to enable coin value EUR 0.10 on a coin feeder unit.

Command name	Code dec	Code hex
<b>Set Peripheral Device Master Inhibit</b>	<b>048</b>	<b>0x30</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

### Description

A command to globally enable or disable the attached coin paying-in mechanism or coin feeder operations. The peripheral device type is address by the device code byte. If the command is not successfully executed, then a NACK will be returned with one data byte giving the reason failure. This value is stored in volatile ram and will be set to disabled state after a reset.

Command has two data bytes. Data 0 is the peripheral code, 0 = coin mech, 1 = coin feeder. Data 1 is the inhibit command. It is a bit field, bit 0 - inhibit status, 0 = device inhibited, 1 = device enabled. Bits 1 - 7 are not used. Example shows master inhibit set to enable device on a coin feeder unit.

Command name	Code dec	Code hex
<b>Get Device Setup (with currency support)</b>	<b>046</b>	<b>0x2E</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command will return the setup of the device, the number of different types of coin/note and the value and currency of each coin/note that the device can handle. The length of the returned data will be 1+(n\*7) bytes long, where n is the number of notes/coins that can be used. The response is formatted as a variable number of bytes, byte 0 being the number of denominations in the system and then 7 bytes for each of the denominations in the system, 4 bytes for the value and 3 bytes ascii country code.

Parameters

This command has no parameters

Command packet example:

dec

003	000	001	046	206
-----	-----	-----	-----	-----

hex

03	00	01	2E	CE
----	----	----	----	----

Response

This example shows a response for a system with 3 denominations. EUR 0.20, EUR 0.50 and GBP 1.00

dec

Command name	Code dec	Code hex
<b>Float By Denomination (with currency support)</b>	<b>045</b>	<b>0x2D</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

**Description**

This command allows the host to request a selected amount of denominations to be left in the device. All other notes/coins will be routed to the cashbox. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK. The example show here is for no security level set.

The command is formatted in a variable number of data bytes. Byte 0 is the number of denominations in the request, the rest are formatted in blocks of 2 bytes - float level of denomination, 4 bytes - value of denomination and 3 bytes ascii value of country code for denomination. This block is then repeated for the required float denominations. Command example shows request to leave levels of 3 x EUR 0.10, 4 x EUR 1.00 and 6 x EUR 0.05 with no security levels set.

dec

[back to index](#)

Command name	Code dec	Code hex
<b>Payout by denomination (with currency support)</b>	<b>044</b>	<b>0x2C</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

**Description**

This command allows the host to request a value amount to be paid from the device specifying the quantity of denominations required. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK. The example show here is for no security level set.

Command has a variable number of data bytes. A command array is made up as follows. Byte 0 - the number of denomination requests. Then each block of bytes makes up a denomination request. Bytes 1-2 the number of denominations to pay, Bytes 3-6 the value of the denomination, Bytes 7-9 the ascii code of the country of denomination. This is then repeated for each denomination. This example is a unsecure request to pay 3 x 0.10 EUR, 7 x 1.00 EUR and 12 x 0.02 EUR.

Command name	Code dec	Code hex
<b>Set Denomination Amount (with currency support)</b>	<b>043</b>	<b>0x2B</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

**Description**

This command will add the number of coins specified in Count to the internal coin counter for the value specified in Value. If the count specified is Zero then the counter will be reset. It is not possible to set the absolute value to anything except zero in a single command. This command should be used each time the coin acceptor routes a coin into the hopper, or when the hopper has coins manually added. This command is invalid for the Smart Payout as the notes are automatically added to the counter by the note validator.

Command has 9 data bytes. Bytes 0-3 denomination value, Bytes 4-5 the level to add, Bytes 6-8 the country code. The example adds 10 EUR 0.50c coins to the system.

<b>Get Denomination Amount (with currency support)</b>	<b>042</b>	<b>0x2A</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command will return the count of the number of coins/notes of the value specified in the command data.

Command has 7 data bytes. Bytes 0-3 is the value, Bytes 4-7 give the ascii country code. This example asks for the number of 5.00 EUR notes stored in the system.

dec

<b>Get Minimum Payout (with currency support)</b>	<b>041</b>	<b>0x29</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command will return the value of the minimum payout that is possible with the coins/notes that are currently in the device. This is effectively the value of the lowest coin/note in the device.

Command data is 3 data bytes. This contains the currency code for the minimum request. This example asks for the min EUR payout.

dec

Command name	Code dec	Code hex
<b>Float Amount (with currency support)</b>	<b>040</b>	<b>0x28</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command allows the host to request a value amount to be left in the device, paying out all excess monies into the device cashbox. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK. The example show here is for no security level set.

Command has 11 data bytes. Bytes 0-3 is the minimum payout remaining amount. Bytes 4-7 are the value to float to. Bytes 8-10 is the country code. This example is a request to float to 20.00 EUR with a min payout of 5.00 EUR

Command name	Code dec	Code hex
<b>Get Routing (with currency support)</b>	<b>038</b>	<b>0x26</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

This command returns the route setting for a particular value denomination. 0 for values routed to be stored for payout, 1 for values to be routed to the external cashbox.

Command has 7 bytes, Bytes 0-3 is the value, byte 4-6 is the country code. This example is request for the route of 0.50 EUR coin.

dec

003	007	001	038	050	000	000	000	069	085	082	177

Command name	Code dec	Code hex
<b>Set Route (with currency support)</b>	<b>037</b>	<b>0x25</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

Description

A command to control the route of a denomination entered in to the device. Money can either be stored in the device available for payout or sent to an external cashbox. For routes to cashbox - In the case of the Smart Payout, notes entered will be routed straight to the cashbox; with the Smart Hopper/Smart System coins will be routed to the cashbox as they are detected by the hopper discrimination system.

This command has 8 data bytes. Byte 0 is the desired route, 0 for payout, 1 for cashbox. Bytes 1-4 is the value, Bytes 5-7 is the ascii country code. This example shows a command to set 5.00 EUR note to route to cashbox.

Command name	Code dec	Code hex
<b>Run Unit Calibration</b>	<b>034</b>	<b>0x22</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

A command to set the host to run its self-calibration function. This is done in response to a calibration fault event type 7 and is used so that the host can optimise its power spread by determining when the device motors will activate. This command will only function if the Host Calibration option is enabled.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	034	218
-----	-----	-----	-----	-----

hex

03	00	01	22	DA

Command name	Code dec	Code hex
<b>Float By Denomination</b>	<b>033</b>	<b>0x21</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

**Description**

This command allows the host to request a selected amount of denominations to be left in the device. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK. The example show here is for no security level set.

The command is formatted in a variable number of data bytes. Byte 0 is the number of denominations in the request, the rest are formatted in blocks of 2 bytes - float level of denomination, 4 bytes - value of denomination. This block is then repeated for the required float denominations. Command example shows request to leave levels of 3 x 0.10, 4 x 1.00 and 6 x 0.05 with no security levels set.

hex

01	05	03	00	01	12	02	00	00	E2
----	----	----	----	----	----	----	----	----	----

event	code (hex)	format	size (bytes)	notes
Idle	00		1	Device is enabled and ready for function.
Dispensing	01	4 bytes giving current value dispensed	5	A requested payout is in process.

Dispensed	02	4 bytes giving total value dispensed	5	A requested payout has finished
Coins Low	03		1	
Empty	04		1	
Jammed	05	4 bytes giving value dispensed at jam	5	A payout has jammed - the value at the jam point is given.
Halted	06	4 byte giving value dispensed at halt	5	A payout has been halted by the host. The value at halt is given.
Floating	07	4 bytes giving value to cashbox	5	A requested float is in process
Floated	08	4 bytes giving value to cashbox	5	A requested float has finished.
Timeout	09	4 bytes giving value dispensed at timeout	5	A requested payout function has timed-out. The value paid at the time-out point is given.
Incomplete payout	0A	4 bytes value dispensed, 4 bytes value requested	9	At start-up a discrepancy between the last paid amount and last requested amount was detected.
Incomplete float	0B	4 bytes value dispensed, 4 bytes value requested	9	At start-up a discrepancy between the last floated amount and last requested amount was detected.
Cashbox paid	0C	4 bytes giving value paid into the cashbox	5	Coins to this value have been passed to the external cashbox.
Coin credit	0D	4 bytes giving value of coin added by attached mech.	5	Coins have been detected as paid into the cashbox by an attached coin mech.
Emptying	0E		1	The payout unit is in the process of emptying its contents to the system cashbox
Emptied	0F		1	The payout unit has emptied its contents to the system cashbox
Fraud attempt	10	4 bytes giving value dispensed at fraud	5	A tamper attempt has been detected.
Disabled	11		1	The unit device is disabled and not available for operation.
Note stored	12		1	A banknote has been passed to the payout store.

Slave reset	13		1	The device has undergone a power-up reset.
Note read	14	4 bytes giving the value of the note	5	A banknote is in the process of being scanned in the device. If the value is not known the data value is 0. When the note value is known, its channel number is the data value.
Note credit	15	4 byte value giving the value of the note credited	5	A banknote has been passed to a secure storage point in the system and the host can safely issue its credit amount.
Note rejecting	16		1	A banknote is in the process of being rejected from the device.
Note rejected	17		1	A banknote has been rejected from the device.
Note stacking	18		1	A banknote is in the process of being moved from the escrow position to the system stack position.
Note stacked	19		1	A banknote has been placed in the system stack position.
Note path jam	1A		1	A banknote has been detected as stuck in the device note path. This is classed as an unsafe jam as the note may be retrievable by the user.
Note stack jam	1B		1	A banknote is detected as being stuck in the device stack mechanism. This is classed as a safe jam as it is not usually retrievable by the user.
Note from front at start	1C	4 byte value of note rejected (0 if unknown)	5	A banknote has been detected as being rejected from the device front during a power-up process.
Note stacked at start	1D	4 byte value of note stacked (0 if unknown)	5	A banknote has been detected as being moved to the device stacker mechanism during a power-up process.
Cashbox full	1E		1	The banknote stacker store has been detected as being full.
Cashbox removed	1F		1	The device removable cashbox has been detected as being removed.
Cashbox replaced	20		1	The device removable cashbox has been detected as being replaced.
Lid open	21		1	
Lid closed	22		1	
Calibration fault	24	1 byte fault code	2	
Attached mech jam	25		1	The coin mech attached to the payout device has been detected as having a jam condition.
Attached mech open	26		1	The coin mech attached to the payout device has been detected as having an open deck.

Smart emptying	27	4 byte emptied value so far.	5	The payout device is in a smart emptying process.
Smart emptied	28	4 byte value emptied	5	The payout device has completed its smart emptying process.
Barcode escrow	34		1	A bar code ticket has been detected and scanned by the device and is held in escrow.
Barcode stacked	35		1	A bar code ticket has been accepted by the device and has passed to the stacker mechanism
Multiple coins added	36	4 byte value of coins added since last request	5	The coin feeder has passed this value to the hopper unit since the last status request.
Peripheral error	37	2 bytes dev code,error code	3	The attached Peripheral to the payout device has generated an error.
Peripheral device disabled	38	1 byte device code	2	The attached Peripheral to the payout device is in a disabled state.
Note held in bezel	39	4 byte value of note held	5	A dispensed banknote is currently held in the bezel. This event is only given if the option is enabled in <a href="#">Set Payout Options</a> command.

Command name	Code dec	Code hex
<b>Get Device Setup</b>	<b>028</b>	<b>0x1C</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command will return the setup of the device, containing the currency, the number of different types of coin/note and the value of each coin/note that the device can handle. The length of the returned data will be 4+(n\*4) bytes long, where n is the number of notes/coins that can be used. The response data is formatted as follows: bytes 0 to 2 - the country code of the device give as ASCII code, byte 3 - the number of denominations available in the device, byte 4 to byte x - the 4 byte value for each of the denominations

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	028	224
-----	-----	-----	-----	-----

hex

03	00	01	1C	E0
----	----	----	----	----

### Response

An example response for a device with EUR currency with 3 note values available for storage/payout: 5 EUR,10 EUR, 20 EUR.

dec

001	016	003	000	069	085	082	003	244	001	000	000	232	003	000	000	208	007	000	000	070
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

01	10	03	00	45	55	52	03	F4	01	00	00	E8	03	00	00	D0	07	00	00	46
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
<b>Set Denomination Amount</b>	<b>027</b>	<b>0x1B</b>

Supported on devices:

SMART Hopper	SMART System
--------------	--------------

### Description

This command will add the number of coins specified in Count to the internal coin counter for the value specified in Value. If the count specified is zero, then the counter will be reset. It is not possible to set the absolute value to anything except zero in a single command. This command should be used each time the coin acceptor routes a coin into the hopper, or when the hopper has coins manually added. This command is invalid for the Smart Payout as the notes are automatically added to the counter by the note validator.

The command data consists of 6 bytes. Bytes 0-3 give the value of the coin to set, bytes 4 - 5 are the number of coins to add to the system. This example shows 20 EUR 0.50 coins being added to the system.

dec

003	006	001	027	050	000	000	000	020	000	149
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

03	06	01	1B	32	00	00	00	14	00	95
----	----	----	----	----	----	----	----	----	----	----

### Response

ACK response for successful update of coin level.

dec

001	000	003	000	252
-----	-----	-----	-----	-----

hex

01	00	03	00	FC
----	----	----	----	----

Example showing that device does not have this value of coin in its system.

dec

001	001	003	005	001	245
-----	-----	-----	-----	-----	-----

hex

Command name	Code dec	Code hex
<b>Get Denomination Amount</b>	<b>026</b>	<b>0x1A</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command will return the count of the number of coins/notes of the value specified in the command data. The response contains two data bytes representing the amount of notes/coins stored for the command data given. If the value given in the command is not present in the device then a NAK is returned with data byte value 1.

An example command requesting the number of EUR 5.00 notes stored in the device.

dec

003	004	001	026	244	001	000	000	233
-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

03	04	01	1A	F4	01	00	00	E9
----	----	----	----	----	----	----	----	----

### Response

Example response showing device has 12 notes stored.

dec

001	002	003	000	012	000	238
-----	-----	-----	-----	-----	-----	-----

hex

01	02	03	00	0C	00	EE
----	----	----	----	----	----	----

An example showing NAK response to a value not present in the device.

dec

001	001	003	005	001	245

Command name	Code dec	Code hex
<b>Get Minimum Payout</b>	<b>025</b>	<b>0x19</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command will return the value of the minimum payout that is possible with the coins/notes that are currently in the device. This is effectively the value of the lowest coin/note in the device.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	025	227
-----	-----	-----	-----	-----

hex

03	00	01	19	E3
----	----	----	----	----

### Response

Example response showing device has a minimum payout available of EUR 0.20

dec

001	003	003	000	020	000	000	229
-----	-----	-----	-----	-----	-----	-----	-----

hex

----	----	----	----	----	----	----	----

[back to index](#)

Command name	Code dec	Code hex
Empty	024	0x18

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

This command allows the host to request the device to empty all of its store of monies into the external cashbox for collection. No values of cashbox payout are given during the empty procedure and after the device has emptied, the denomination counters will all be set to zero. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK.

### Parameters

This command has no parameters

Command packet example:

dec

003	000	001	024	228
-----	-----	-----	-----	-----

hex

Command name	Code dec	Code hex
<b>Float Amount</b>	<b>023</b>	<b>0x17</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

**Description**

This command allows the host to request a value amount to be left in the device, paying out all excess monies into the device cashbox. The format of the command depends on the security level setting of the device. This may be obtained using the Request Encryption Support (header 111) command, which returns as part of its data, the [Command level] byte. Successful commands sent with the security levels set return an event count byte. This byte is value 0 at reset and then wraps from 255 to 1. It increments on every successful payout, float or empty command. Non-security levels just return an ACK. The example show here is for no security level set.

Float amount to EUR 5.30 (no security bytes)

[back to index](#)

Command name	Code dec	Code hex
<b>Set Routing</b>	<b>020</b>	<b>0x14</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

A command to control the route of a denomination entered in to the device. Money can either be stored in the device available for payout or sent to an external cashbox. For routes to cashbox - In the case of the Smart Payout, notes entered will be routed straight to the cashbox; with the Smart Hopper/Smart System coins will be routed to the cashbox as they are detected by the hopper discrimination system.

Command has 5 data bytes. Byte 0 sets the desired route, 0 for payout,1 for cashbox. Bytes 1 to 4 are the value of the coin to route. This example command shows EUR 2.00 being set to route to payout.

dec

003	005	001	020	000	200	000	000	000	027
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

03	05	01	14	00	C8	00	00	00	1B
----	----	----	----	----	----	----	----	----	----

An example command showing EUR 0.50 coin set to be routed to the cashbox.

dec

003	005	001	020	001	050	000	000	000	176
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

hex

03	05	01	14	01	32	00	00	00	B0
----	----	----	----	----	----	----	----	----	----

### Response

If successful route change returns ACK

dec

001	000	003	000	252
-----	-----	-----	-----	-----

hex

01	00	03	00	FC
----	----	----	----	----

If route cannot be set (value of coin/note not found) a NAK is returned with data byte 1.

Command name	Code dec	Code hex
<b>Request Comms Revision</b>	<b>004</b>	<b>0x4</b>

Supported on devices:

SMART Hopper	SMART Payout	SMART System
--------------	--------------	--------------

### Description

As a reply to this command, the Smart Payout or Hopper sends the implementation level of the cctalk® protocol and the communication software version. E.g. Data 1 = 0 Data 2 = 1 Data 3 = 2 Data 4 = 0 Gives a revision of 1.2.0. This version ties in with the version of the specification document and allows updates and changes to be tracked.

### Parameters
